ABSTRACT

This report presents basic data on the chemical and physical characteristics of water in the estuaries of Texas for October 1976-September 1978. The properties or constituents that were measured in the field are dissolved oxygen (DO), specific conductance, temperature, pH, and transparency by Secchi disk. Analyses conducted in the laboratory include the principal inorganic ions, biochemical oxygen demand (BOD), total organic carbon (TOC), ammonium, nitrite, nitrate, and total phosphate.

**CHEMICAL AND PHYSICAL CHARACTERISTICS
OF WATER IN ESTUARIES OF TEXAS
OCTOBER 1976—SEPTEMBER 1978**

By

J. C. Fisher
U.S. Geological Survey

INTRODUCTION

Purpose and Scope of the Investigation

The Texas Water Plan (Texas Water Development Board, 1968) proposes development and utilization of water resources in Texas and includes provision for the use and preservation of water in the estuaries of the State. Management of estuarine waters requires knowledge of the hydrodynamics and of the continuing changes in the chemical and physical characteristics of water in the estuaries.

In September 1967, the U.S. Geological Survey and the Texas Water Development Board (now Texas Department of Water Resources) began a cooperative water-resources investigation of the principal estuaries along the Texas Coast (Figure 1) except the Rio Grande estuary, which is under the jurisdiction of the International Boundary and Water Commission, United States and Mexico.

The objectives of the investigation are to define: (1) the occurrence, source, and distribution of nutrients; (2) the physical, organic, and inorganic water-quality constituents and their areal distribution and time variations; (3) the chemical and physical characteristics of gulf water that enters the estuaries; (4) the occurrence, quality, quantity, and dispersion of drainage entering the estuarine systems; and (5) the current patterns, directions, and rates of water movement.

The coastal waters of Texas are not classical estuaries, but are similar to them in ecosystems and mixing phenomena. A description of various types of estuaries is presented in "Estuaries" edited by Lauff (1967, p. 3-11). The term estuary as used in this report, refers to concomitant water bodies in which streamflow mixes with seawater.

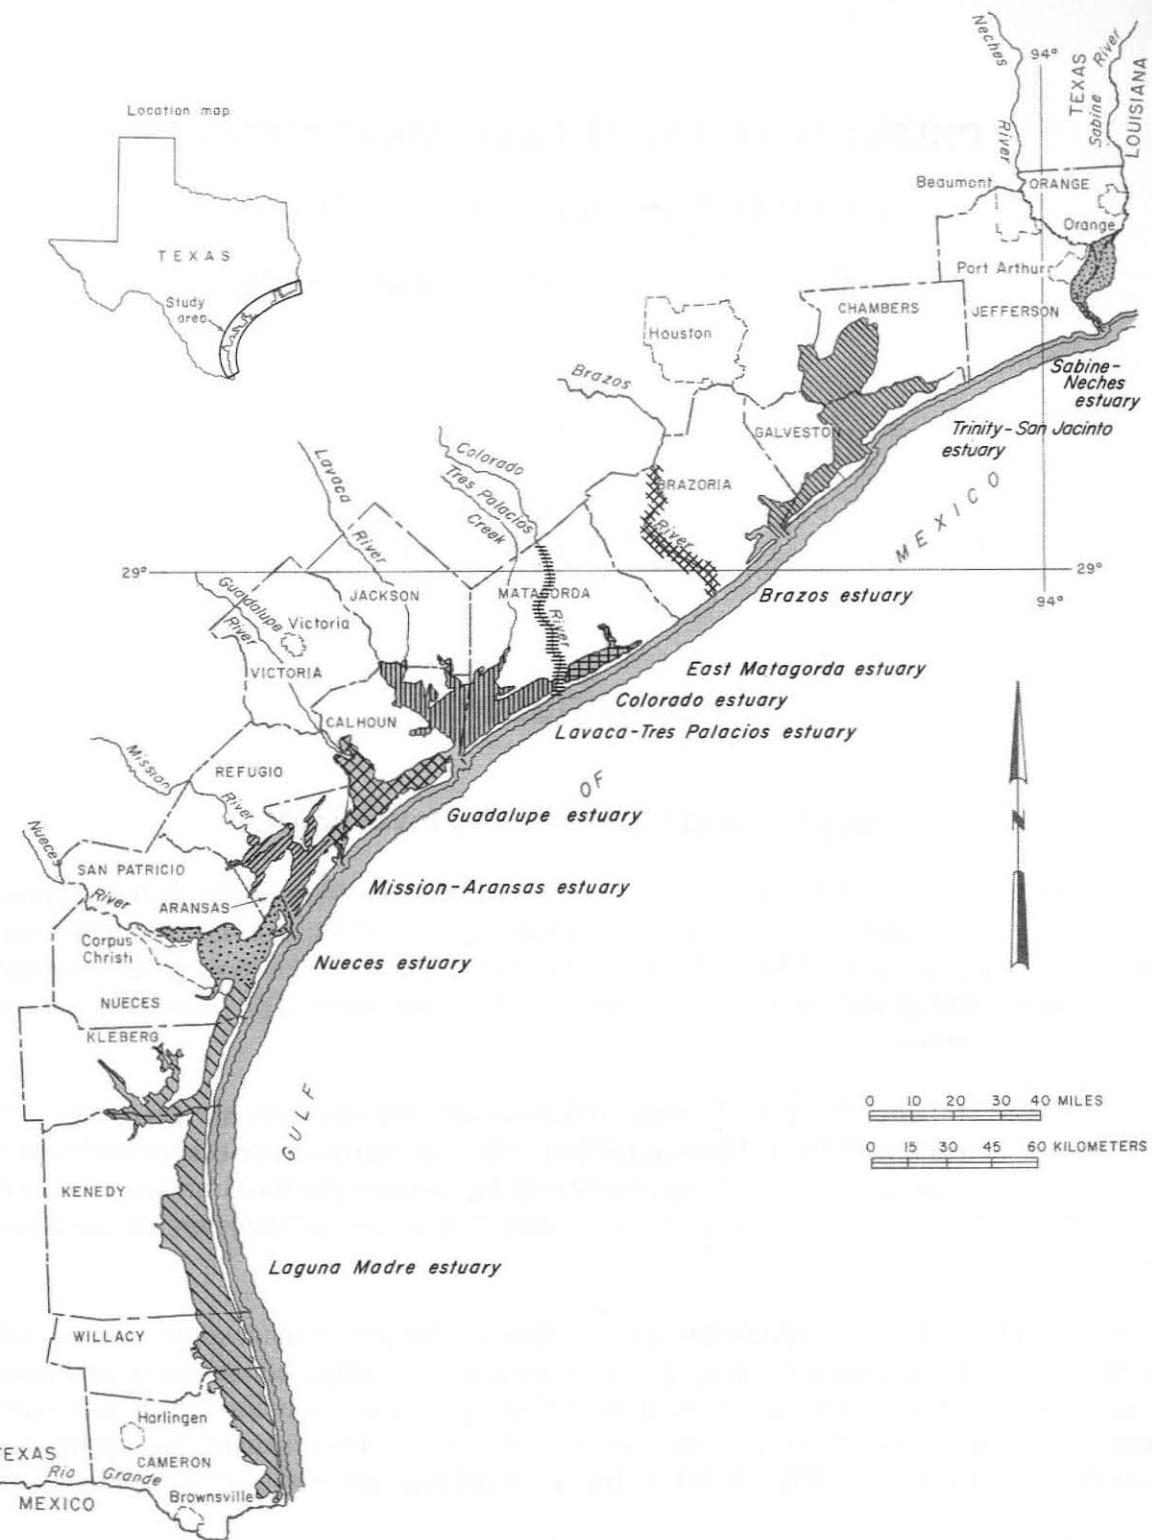

Figure 1
Locations of the Estuaries

Base from Official State Highway Map of Texas, 1971

Status of the Project

The first three objectives of the project are being met by a three-phased water-quality data-collection program of: (1) reconnaissance for establishment of an optimum data-collection network; (2) repetitive surveys throughout this network to determine the general chemical and physical characteristics of the estuarine systems; and (3) continued data collection at a reduced number of sites and at a reduced frequency to maintain definition of the chemical and physical characteristics of each estuarine system and of the relationship between systems. The first two phases have been completed and the third phase began in September 1973.

The fourth objective of the project is being met by data collection at six continuous streamflow-measuring stations and 11 stations at which monthly data on streamflow and water quality are obtained. The dispersion of water entering an estuary is being documented under the data-collection activities to meet the first three objectives.

The fifth objective of the project is being met by short-duration, intensive studies of inflow. Two such studies will be completed for each estuary. The studies on the Guadalupe estuary were completed in November 1970 and August 1973; the studies on the Lavaca-Tres Palacios estuary were completed in March 1971 and October 1972; the studies on the Mission-Aransas and Nueces estuaries were completed in November 1971 and May-June 1974; the studies on the Sabine-Neches estuary were completed in September 1974 and July 1975; one study on the Trinity-San Jacinto estuary was completed in July 1976; and two studies on the Colorado estuary were completed in May and July 1977. These studies are providing data on inflow and exchange of water through the passes. Three short-duration studies of water quality and water exchange were done on the Trinity River tidal marsh in November and December 1976 and July and August 1977.

Previous and Related Reports

This report, which presents data collected during water years 1977-78, is one of a series of basic-data reports that have been prepared since 1970 (Hahl and Ratzlaff, 1970, 1972, 1973, and 1975; Ratzlaff, 1976; Lind and Ratzlaff, 1979; and Lind, 1980 and 1983). A report by Grozier and others (1968, p. 47-61) includes data collected during flooding caused by Hurricane Beulah.

Metric Conversions

Metric equivalents of inch-pound units of measurements are given in parentheses in the text. The inch-pound units used in this report may be converted to metric units by using the following conversion factors:

<u>From</u>	<u>Multiply by</u>	<u>To obtain</u>
acre-foot	1,233	cubic meter (m^3)
cubic foot per second (ft^3/s)	.02832	cubic meter per second (m^3/s)
foot	.3048	meter (m)

<u>From</u>	<u>Multiply by</u>	<u>To obtain</u>
mile	1.609	kilometer (km)
square mile	2.590	square kilometer (km^2)

Acknowledgements

The U.S. Army Corps of Engineers (Galveston District), the Texas Parks and Wildlife Department, and the Texas Department of Water Resources provided data and field assistance. Many private citizens and commercial fishermen furnished information on historical changes and existing conditions in the estuaries.

DATA-COLLECTION METHODS

Approximately 234 data-collection sites were visited during the 1977-78 water years. About 50 percent of these sites are located adjacent to or between navigation aids, bridge piers, power poles, survey platforms, well structures, or other landmarks and can be reoccupied exactly. About 19 percent of the sites are close to shore features or reefs and are located by onboard radar or by compass heading and distance from the feature and water depth at the site; these sites can be reoccupied within 100 feet (30.5 m). About 31 percent of the sites are remote to any reference. They are reached by traveling from a known landmark at a known speed on a predetermined compass course. Verification of site location is made by checking the alignment of one or more distant landmarks by visual observation or by onboard radar. These sites can be reoccupied within approximately 0.25 mile (0.4 km).

At each data-collection site, field data are collected from several points along a vertical. Samples for laboratory analyses are collected from a predetermined number of data-collection sites and at other sites in the network when significant changes in field data indicate a need for additional samples.

The properties or constituents that are measured in the field are dissolved oxygen (DO), specific conductance, temperature, pH, and transparency by Secchi disk. Analyses conducted in the laboratory include the principal inorganic ions, biochemical oxygen demand (BOD), total organic carbon (TOC), ammonium, nitrite, nitrate, and total phosphate.

Field Instruments

The field instruments used in this investigation are given in the following table. The mention of the names of the manufacturers of the instruments is for identification purposes only and does not constitute an endorsement by the Geological Survey.

<u>Parameter measured</u>	<u>Instrument</u>	<u>Model</u>	<u>Manufacturer</u>
pH, dissolved oxygen, temperature, specific conductance	Surveyor	6	Hydrolab Corporation

<u>Parameter measured</u>	<u>Instrument</u>	<u>Model</u>	<u>Manufacturer</u>
pH	Specific ion meter	401	Orion Research
pH	pH meter	7417	Leeds and Northrup
Dissolved oxygen	Oxygen meter	54	Yellow Springs Instruments

The instruments used for pH measurements were calibrated daily during each water-quality survey by using three standards: pH 4.0, 7.0, and 10.0. The dissolved-oxygen meters were calibrated at least twice daily by using the oxygen-saturation data compiled by the American Public Health Association and others (1971, p. 480). The Surveyor was calibrated using the procedure provided by the manufacturer. In addition, instrument calibrations were rechecked at the end of each day.

Treatment of Samples

All water samples, except those for TOC, were collected in plastic throw-away bottles. The BOD, TOC, and nutrient samples were chilled and stored in crushed ice and shipped to the laboratory as soon as possible.

Water samples for the principal dissolved constituents were filtered through 0.45-micrometer membrane filters. Water samples for dissolved inorganic cations, heavy metals, and other selected trace constituents were treated with 1:1 nitric acid until the pH of the sample was less than 2.0.

QUALITY OF WATER IN THE ESTUARIES

Sabine-Neches Estuary

The Sabine-Neches estuary, which has an area of about 100 square miles (260 km^2), consists of the tidal parts of the Sabine and Neches Rivers and other tributaries, Sabine Lake, the Sabine-Neches Canal, the Port Arthur Canal, parts of the Intracoastal Waterway, and Sabine Pass (Figure 2). Water depth at mean low water is greater than 40 feet (12.2 m) in dredged parts of the rivers, canals, and pass; about 15 feet (4.6 m) in the Intracoastal Waterway; and generally about 10 feet (3.0 m) in Sabine Lake.

Water-quality data (Table 1) were collected during October-December 1976; January, February, June, August, and September 1977; and February, May, and June 1978.

Trinity-San Jacinto Estuary

The Trinity-San Jacinto estuary, which has an area of about 590 square miles (1,530 km²), consists of the tidal parts of the Trinity and San Jacinto Rivers and other tributaries, the Houston Ship Channel, part of the Intracoastal Waterway, Galveston Bay, East Bay, West Bay, and Trinity Bay (Figure 3). Water depth at mean low water is less than 10 feet (3.0 m) in East Bay, West Bay, and Trinity Bay. Galveston Bay is generally less than 10 feet (3.0 m) deep except near Bolivar Road where the depth increases to about 40 feet (12.2 m). The Houston Ship Channel is more than 40 feet (12.2 m) deep, and the Intracoastal Waterway is about 15 feet deep (4.6 m).

Water-quality data (Table 2) were collected during October-December 1976; February and April-September 1977; and January, February, and June 1978. Data for the San Jacinto River and for the upper part of the Houston Ship Channel are being collected by other agencies.

Table 2A.--Quality of water in the Trinity-San Jacinto estuary, water years 1977-78
Field Determinations

(FT = feet; MICROMHOS = micromhos per centimeter at 25° Celsius; DEG C = degrees Celsius; M = meters;
MG/L = milligrams per liter)
