lexas Mater Conditions Report

Earthtrekkers.com, Lady Bird Lake, Austin, TX

February 2022

Water News:

- The goal of the Statewide Synthesis of Environmental Flow Studies (published here: https://www.twdb.texas.gov/publications/reports/contracted_reports/index.asp) was to evaluate: the applicability of each environmental flow study for meeting the goals of defining a sound ecological environment, the expected variability in ecosystem indicators of a sound ecological environment, the potential need for refining adopted flow standards, and strategies to provide for environmental flows in five basin-bay systems.
- The name Bois d'Arc Lake has been officially recognized by the U.S. Board of Geographic Names of the U.S. Department of the Interior and is the first major reservoir to be built in Texas in over 30 years. https://waterdatafortexas.org/reservoirs/individual/bois-darc

RAINFALL

This month very little to no rain [yellow, orange, and red shading, Figure 1(a)] fell over the High Plains, western Low Rolling Plains, Trans Pecos, much of the Edwards Plateau, southwestern North Central, much of South Central, Southern, western Lower Valley, and much of the Upper Coast climate divisions. Some rainfall [light blue and dark blue shading, Figure 1(a)] was recorded in eastern Low Rolling Plains, northern Edwards Plateau, northern South Central, much of the North Central, eastern Upper Coast, and East Texas climate divisions. Above average rainfall [dark blue shading, Figure 1(a)] reaching 6.6 inches in the northeastern parts of the state.

Monthly rainfall for February was below average, compared to historical data from 1991–2020, for most of the state [yellow and orange shading, Figure 1(b)]. Average rainfall [green shading, Figure 1(b)] was seen in northwestern and southern North Central, areas of northern and southern Low Rolling Plains, northern East Texas, western Trans Pecos, northwestern South Central, and southeastern Lower Valley climate divisions. Above average rainfall [light blue shading, Figure 1(b)] was seen in the western Trans Pecos climate division.

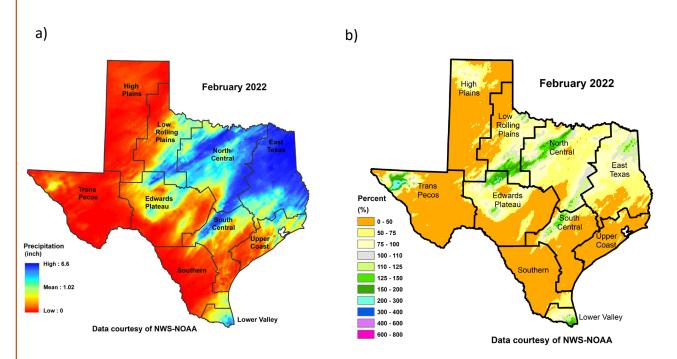

Figure 1: (a) Monthly accumulated rainfall and (b) Percent of normal rainfall

RESERVOIR STORAGE

At the end of February 2022, total conservation storage* in 123 of the state's major water supply reservoirs was 24.6 million acre-feet or 77 percent of total conservation storage capacity (Figure 2). This is approximately 0.12 million-acre-feet more than a month ago and approximately 1.04 million acre-feet less than at the end of February 2021.

Statewide monitored major water supply reservoir conservation storage

Figure 2: Statewide reservoir conservation storage

Out of 123 reservoirs in the state, 14 reservoirs held 100 percent of conservation storage capacity (Figure 3). Additionally, 43 were at or above 90 percent full. Nine reservoirs remained below 30 percent full: Bois d'Arc (23 percent full), E.V. Spence (24 percent full), Greenbelt (16 percent full), Mackenzie (8 percent full), O. C. Fisher (6 percent full), Palo Duro Reservoir (1 percent full), Falcon (23 percent full), Medina Lake (25 percent full), and White River (18 percent full). Elephant Butte Reservoir (located in New Mexico) was 11 percent full.

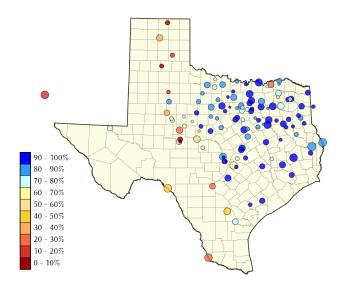

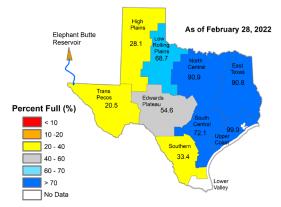

Figure 3: Reservoir conservation storage at end-February expressed as percent full (%)

*Storage is based on end of the month data in 123 major reservoirs that represent 96 percent of the total conservation storage capacity of 188 major water supply reservoirs in Texas plus Elephant Butte Reservoir in New Mexico. Major reservoirs are defined as having a conservation storage capacity of 5,000 acre-feet or greater. Only the Texas share of storage in border reservoirs is counted.

Total regionally combined conservation storage was at or above normal (storage ≥70 percent full) in East Texas (90.8 percent full), North Central (90.9 percent full), South Central (72.1 percent full), and the Upper Coast (99.0 percent full) climate divisions (Figure 4). Conservation storage for the Low Rolling Plains (68.7 percent full) climate division was abnormally low (Figure 4). The Edwards Plateau climate division had moderately low conservation storage (54.6 percent full, Figure 4). The High Plains (28.1 percent full), Southern (33.4 percent full), and the Trans Pecos (20.5 percent full) climate divisions had severely low conservation storage (Figure 4).

Combined conservation storage by river basin or sub-basin was normal to high (>70 percent full, Figure 5) in the Upper and Lower Red, Upper and Lower Trinity, Sulphur, Cypress, Upper and Lower Sabine, Upper and Lower Brazos, San Jacinto, Neches, Lower Colorado, Lavaca, and Guadalupe river basins. The Upper Colorado and Nueces river basins had moderately low conservation storage (40–60 percent full, Figure 5), and the San Antonio, Upper/Mid Rio Grande, Lower Rio Grande, and Canadian river basins had severely low conservation storage (20–40 percent full, Figure 5).

Regional Reservoir Storage Condition

Percent full is calculated by combined conservation storage of all reservoirs in a climate region (dead pool is excluded) **Figure 4:** Reservoir Storage Index* by climate division at 2/28/2022

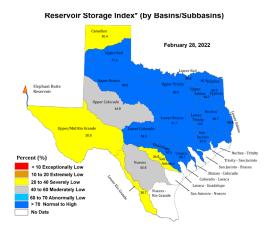

Figure 5: Reservoir Storage Index* by river basin/sub-basin at 2/28/2022

*Reservoir Storage Index is defined as the percent full of conservation storage capacity.

*Total volume below elevation of conservation pool top is used as conservation storage capacity, because the dead pool storage is unknown.

**Monthly and yearly changes do not include reservoirs that did not have data in the last month or last year, respectively.

STREAMFLOW CONDITIONS

Parts of the state had near normal streamflow in February 2022 (25–75th percentile, green shading, Figure 6). Below normal streamflow (10–24th percentile, orange shading in Figure 6) was recorded in the Upper and Lower Red, Upper and Lower Brazos, Upper and Lower Colorado, Upper and Lower Trinity, Cypress, Sulphur, Upper and Lower Sabine, Neches, San Antonio, Guadalupe, Nueces, and Nueces-Rio Grande river basins.

Much below normal stream flow (< 10th percentile, dark red shading in Figure 6) was seen in the Canadian, Upper and Lower Red, Upper and Lower Brazos, Upper Sabine, Neches, Nueces, Lower Colorado, and Pecos river basins. Record lows (bright red shading in Figure 6) were seen in the Upper Pecos and Cypress river basins. The Colorado-Lavaca river basin had above normal stream flow (76–90 percentile, light blue shading, Figure 6).

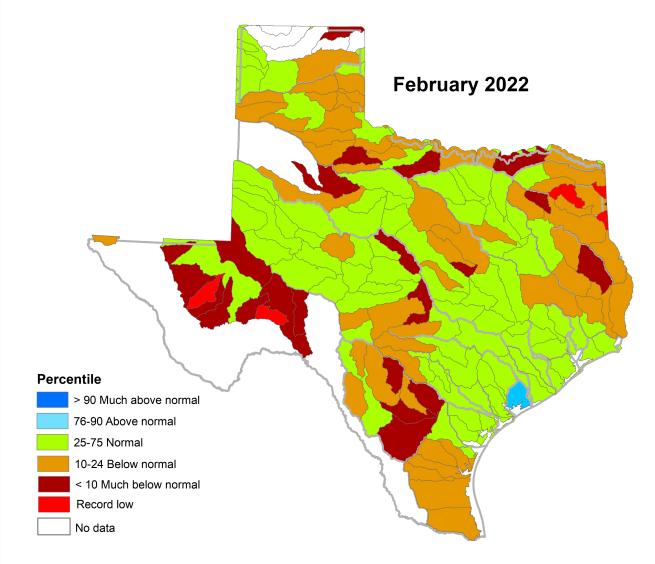

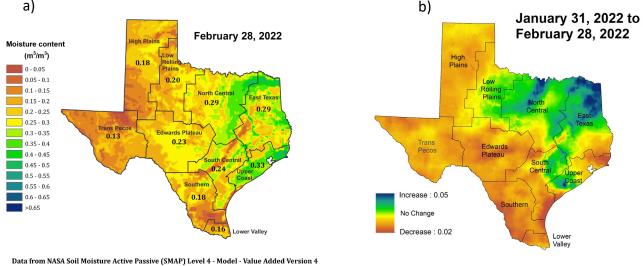

Figure 6: Runoff percentiles by the U.S. Geological Survey's Hydrologic Unit Code

SOIL MOISTURE

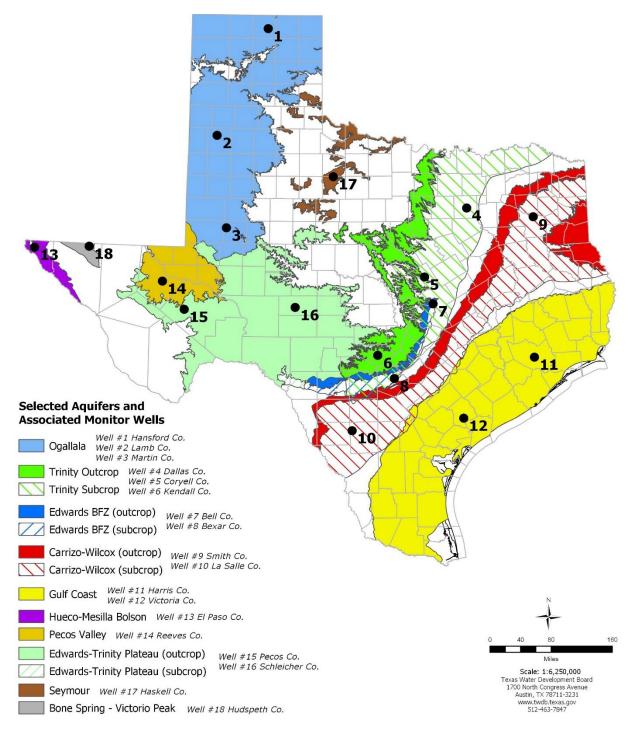

Root zone soil moisture at the end of February 2022 [Figure 7(a)] was moderate [> 0.20 cubic meters of water per bulk cubic meter soil (m^3/m^3)] across most of the state. Low soil moisture [< 0.15 cubic meters of water per bulk cubic meter soil (m^3/m^3)] was seen in portions of the High Plains, Low Rolling Plains, Trans Pecos, Edwards Plateau, Southern, Lower Valley, southwestern East Texas, areas of western North Central, southwestern Upper Coast, southern South Central and particularly the northwest stretching across the climate division to the northeast. Average soil moisture [0.3 cubic meters of water per bulk cubic meter soil (m^3/m^3)] was seen in the North Central, South Central, northeastern Southern, across areas of East Texas, and most of the Upper Coast climate divisions.

Compared to conditions at the end of January 2022, soil moisture content increased [green to blue shading in Figure 7(b)] in eastern Low Rolling Plains, North Central, northeastern South Central, western Upper Coast, and East Texas climate divisions. Soil moisture content decreased [yellow, orange, and brown shading in Figure 7(b)] in the High Plains, Trans Pecos, areas of the Low Rolling Plains, the Edwards Plateau, southern North Central, Southern, pats of South Central, Lower Valley, southern East Texas, and eastern portions of the Upper Coast climate divisions.

Soil moisture content is shown as volume of water per unit volume of bulk soil. Root zone: 0 to 1 meter depth.

Figure 7: (a) Root zone soil moisture conditions in February 2022 and (b) the difference in root zone soil moisture between end-January 2022 and end-February 2022

FEBRUARY 2022 GROUNDWATER LEVELS IN MONITORING WELLS

Water-level measurements were available for 16 key monitoring wells in the state. Recorders in 2 wells (#1 and #14 on map) were offline during the reporting period. Water levels rose in 8 monitoring wells since the beginning of February, ranging from an increase of 0.02 feet in the Haskell County Seymour Aquifer well (#17 on map) to 3.99 feet in the Kendall County Trinity Aquifer well (#6 on map). Water levels declined in 7 monitoring wells, ranging from a decline of -0.07 feet in the Lamb and Martin County Ogallala Aquifer wells (#2 and #3 on map) to -1.23 feet in the Victoria County Gulf Coast Aquifer well (#12 on map). The J-17 well (#8 on map) in San Antonio recorded a water level of 69.10 feet below land surface or 661.90 feet above mean sea level. Water levels are 1.90 feet above the Stage I critical management level for the San Antonio portion of the Edwards (Balcones Fault Zone) Aquifer.

* Well numbers used in this publication on the aquifer map to indicate the monitoring well location (numbers 1 - 18) are different than the TWDB's seven-digit state well number.

Monitoring Well	February (depth to water, feet)	January (depth to water, feet)	Month Change	Year Change	Historical Change*	First Measured (year)

* Change since the original measurement taken on the date indicated in the last column. The historical changes shown for recorder wells #1 and #14 are based off the most recent water level records from December and October 2021, respectively.

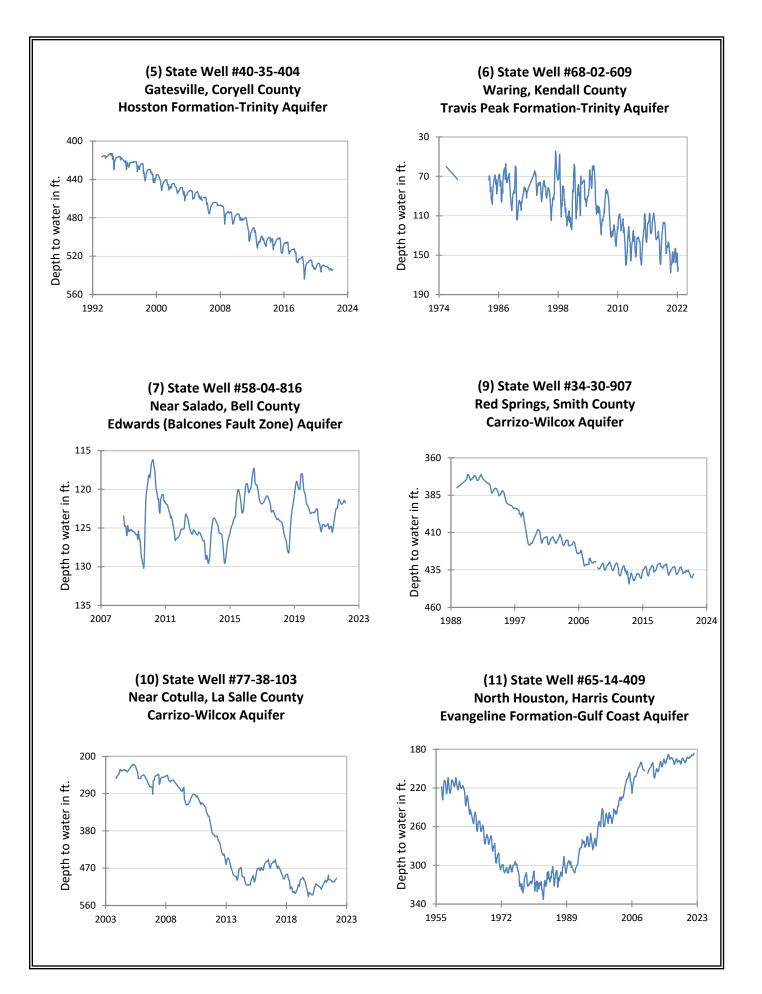

** Measurement not shown on the hydrograph.

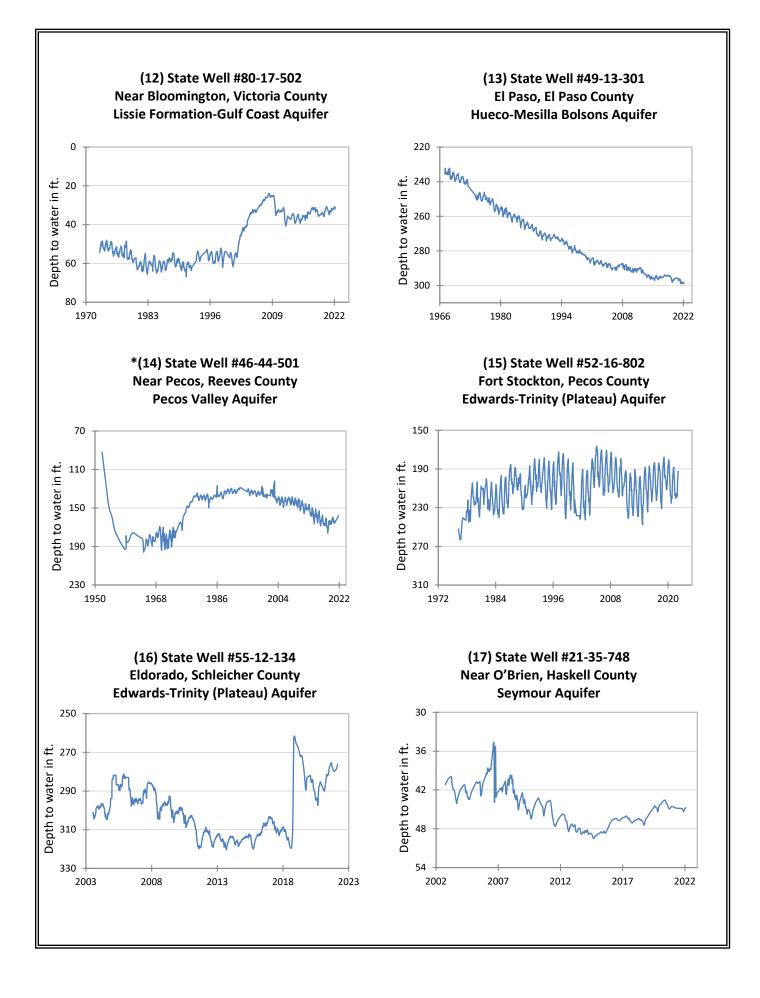

NA (not available)

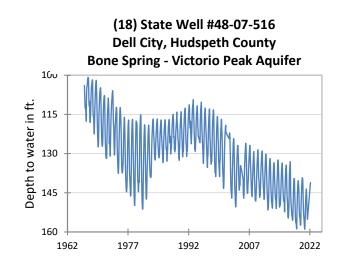

All data are provisional and subject to revision

FEBRUARY 2022 MONITORING WELL HYDROGRAPHS

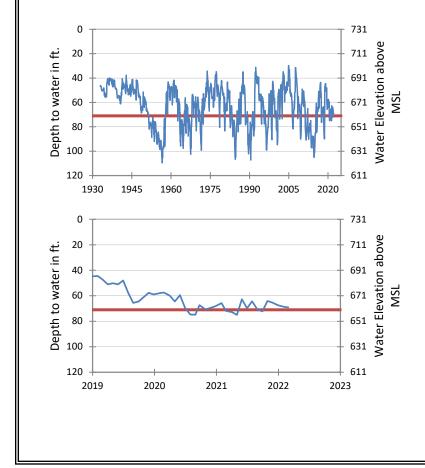

(8) State Well #68-37-203 (J-17) San Antonio, Bexar County Edwards (Balcones Fault Zone) Aquifer

The late February water-level measurement in this Edwards (Balcones Fault Zone) Aquifer well, located at an elevation of 731 feet above mean sea level, was 69.10 feet below land surface, or 661.90 feet above mean sea level. This was 0.50 feet below last month's measurement, 2.80 feet above last year's measurement, and 22.46 feet below the initial measurement recorded in 1932.

Water levels below the red line indicate periods in which Edwards Aquifer Authority Stage 1 drought restrictions are in effect. In February 2022, Stage 1 drought restrictions were not in effect because the aquifer remained above the Stage 1 critical management level.

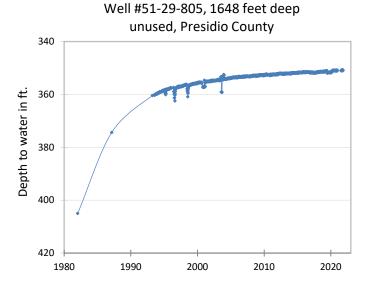

*Recorder wells #1 and #14 were offline in February 2022 and did not record data.

HYDROGRAPH OF THE MONTH

Each month this space features a new hydrograph (marked with the • symbol on the map) depicting different aquifers and their conditions in Texas.

The West Texas Bolsons Aquifer is a minor aquifer located in several basins, or bolsons, in far west Texas. The aquifer occurs as waterbearing, basin-fill deposits as much as 3,000 feet thick. It is composed of eroded materials that vary depending on the mountains bordering the basins and the manner in which the sediments were deposited. Sediments range from the fine-grained silt and clay of lake deposits to the coarse-grained volcanic rock and limestone of alluvial fans. Freshwater saturated thickness averages about 580 feet. Groundwater quality varies depending on the basin, ranging from freshwater, containing less than 1,000 milligrams per liter of total dissolved solids, to slightly to moderately saline water, containing between 1,000 and 4,000 milligrams per liter of total dissolved solids. Groundwater in the central and southern regions of the aquifer commonly exceeds maximum contaminant level for arsenic, fluoride, gross alpha radiation, or nitrate-N. The northern regions of the aquifer are more likely to exceed the maximum contaminant level for total dissolved solids. Groundwater is used for irrigation and livestock throughout the area and for municipal supply in the cities of Presidio, Sierra Blanca, Valentine, and Van Horn.

The initial water level measurement taken by the Texas Water Development board was 405 feet below land surface in January of 1982. The TWDB took additional measurements in 1987, 1992, and 1993 before installing an automatic water-level recorder in the unused well in July of 1993. The recorder continues to take hourly measurements (available online) and daily measurements (in the groundwater database). The period of record shows a rapid phase of recovery in water level from approximately 1982 to 1993, followed by a phase of gradual and steady recovery roughly equal to 0.33 ft/yr. This may be attributed to a decrease in pumping for irrigation in the local area.

Far away (left), and close-up (right) images of well #51-29-805.
